DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of group I claims 1-17, 52-55, and 67-70 in the reply filed on 11/30/2006 is acknowledged.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 3. Claims **1-2**, **4**, **6-9**, **11-14**, **16**, **52-53**, **55**, **67-68**, **and 70** are rejected under 35 U.S.C. 102(e) as being anticipated by Kole (U.S. Patent No. 6,501,064).

Regarding claim 1, Kole discloses:

An image array pixel comprising: a charge sharing node; and a reset transistor having source/drain regions on opposite sides of a gate, one of said source/drain regions being switchably coupled to a first and second voltage, the other of said source/drain regions being coupled to said node (7:15-8:10, high and low).

Regarding claim 2, see the rejection of claim 1 and note that Kole further discloses:

Art Unit: 2622

First voltage is higher than said second voltage (7:15-8:10, high and low).

Regarding claim 4, see the rejection of claim 1 and note that Kole further discloses:

One of said source/drain regions is coupled to only one of said first and second voltages at a time (7:15-8:10 high and low).

Regarding claim **6**, see the rejection of claim 1 and note that Kole further discloses:

Pixel is a three-transistor pixel (7:15-8:10).

Regarding claim 7, see the rejection of claim 1 and note that Kole further discloses:

Pixel is a four-transistor pixel (8:11-20).

Regarding claim 8, Kole discloses:

A pixel circuit, comprising: a photo sensor; a storage node for receiving charges from said photo sensor; and a reset transistor for resetting said storage node, said reset transistor being switchably coupled to a first and second voltage level (7:15-8:10, high and low).

Regarding claim **9**, see the rejection of claim 8 and note that Kole further discloses:

First voltage level is lower than said second voltage level (7:15-8:10).

Art Unit: 2622

Regarding claim **11**, see the rejection of claim 8 and note that Kole further discloses:

Pixel is a three-transistor pixel (7:15-8:10).

Regarding claim **12**, see the rejection of claim 8 and note that Kole further discloses:

Pixel is a four-transistor pixel (8:11-20).

Regarding claim 13, Kole discloses:

An image array pixel comprising: a change storing node; a reset transistor having source/drain regions on opposite sides of a gate, one of said source/drain regions being switchably coupled to a first and second voltage, the other of said source/drain regions being coupled to said node; and a source-follower transistor having source/drain regions on opposite sides of a gate, one of said source/drain regions of said source-follower transistor being coupled to said first and second voltage and to said one of said source/drain regions of said reset transistor (7:15-8:10, high and low).

Regarding claim **14**, see the rejection of claim 13 and note that Kole further discloses:

First voltage is higher than said second voltage (7:15-8:10).

Regarding claim **16**, see the rejection of claim 13 and note that Kole further discloses:

First source/drain of reset transistor is coupled only to one of said first and second voltages at a time (7:15-8:10).

Art Unit: 2622

Regarding claim **52**, Kole discloses:

A processing system, comprising: a processor (inherent); an imager array coupled to said processor, one pixel of said image array comprising: a charge sharing node; and a reset transistor having source/drain regions on opposite sides of a gate, one of said source/drain regions being switchably coupled to a first and second voltage, the other of said source/drain regions being coupled to said node (7:15-8:10, high and low).

Regarding claim **53**, see the rejection of claim 52 and note that Kole further discloses:

First voltage is higher than said second voltage (7:15-8:10).

Regarding claim **55**, see the rejection of claim 52 and note that Kole further discloses:

One of said source/drain regions is coupled to only one of said first and second voltages at a time (7:15-8:10).

Regarding claim **67**, Kole discloses:

An imaging device, comprising: a processor (inherent); an imager array coupled to said processor, one pixel of said image array comprising: a charge sharing node; and a reset transistor having source/drain regions on opposite sides of a gate, one of said source/drain regions being switchably coupled to a first and second voltage, the other of said source/drain regions being coupled to said node (7:15-8:10, high and low).

Art Unit: 2622

Regarding claim **68**, see the rejection of claim 67 and note that Kole further discloses:

First voltage is higher than said second voltage (7:15-8:10).

Regarding claim **70**, see the rejection of claim 67 and note that Kole further discloses:

One of said source/drain regions is coupled to only one of said first and second voltages at a time (7:15-8:10).

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims **3**, **5**, **10**, **15**, **17**, **54**, **and 69** are rejected under 35 U.S.C. 103(a) as being unpatentable over Kole.

Regarding claim 3, see the rejection of claim 1 and note that Kole discloses a low signal level during integration as a second voltage. Kole is silent with regards to the second voltage being ground potential. Official Notice is taken that it was well known the art use ground potential as a low signal level for the second voltage. An advantage to doing so is that ground potential is further away from a transistor "turn on" voltage than an arbitrary low signal level voltage thus avoiding a partial transistor "turn on". For

Art Unit: 2622

this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's low signal level be ground potential.

Regarding claim **5**, see the rejection of claim 1 and note that Kole is silent with regards to the pixel not receiving any light. Official Notice is taken that it was well known at the time the invention was made to create imaging devices where the pixels don't receive any light during reset. An advantage to doing so is that dark current can be read out for image correction. For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's pixels not receive any light.

Regarding claim 10, see the rejection of claim 8 and note that Kole discloses a low signal level during integration as a second voltage. Kole is silent with regards to the second voltage being ground potential. Official Notice is taken that it was well known the art use ground potential as a low signal level for the second voltage. An advantage to doing so is that ground potential is further away from a transistor "turn on" voltage than an arbitrary low signal level voltage thus avoiding a partial transistor "turn on". For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's low signal level be ground potential.

Regarding claim **15**, see the rejection of claim 13 and note that Kole discloses a low signal level during integration as a second voltage. Kole is silent with regards to the second voltage being ground potential. Official Notice is taken that it was well known the art use ground potential as a low signal level for the second voltage. An advantage to doing so is that ground potential is further away from a transistor "turn on" voltage

than an arbitrary low signal level voltage thus avoiding a partial transistor "turn on". For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's low signal level be ground potential.

Regarding claim 17, see the rejection of claim 13 and note that Kole is silent with regards to the pixel not receiving any light. Official Notice is taken that it was well known at the time the invention was made to create imaging devices where the pixels don't receive any light during reset. An advantage to doing so is that dark current can be read out for image correction. For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's pixels not receive any light.

Regarding claim **54**, see the rejection of claim 52 and note that Kole discloses a low signal level during integration as a second voltage. Kole is silent with regards to the second voltage being ground potential. Official Notice is taken that it was well known the art use ground potential as a low signal level for the second voltage. An advantage to doing so is that ground potential is further away from a transistor "turn on" voltage than an arbitrary low signal level voltage thus avoiding a partial transistor "turn on". For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's low signal level be ground potential.

Regarding claim **69**, see the rejection of claim 67 and note that Kole discloses a low signal level during integration as a second voltage. Kole is silent with regards to the second voltage being ground potential. Official Notice is taken that it was well known the art use ground potential as a low signal level for the second voltage. An advantage

Art Unit: 2622

to doing so is that ground potential is further away from a transistor "turn on" voltage than an arbitrary low signal level voltage thus avoiding a partial transistor "turn on". For this reason it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Kole's low signal level be ground potential.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nicholas G. Giles whose telephone number is (571) 272-2824. The examiner can normally be reached on Monday through Friday from 7:30am to 4:00pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ngoc - Yen Vu can be reached on (571) 272-7320. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
